TITLE: The Horizontal MP55 (MP55) Broaching Assembly

PERIODICAL: Byulleten' tekhniko-ekonomicheskoy informatsii, 1960, No. 8, pp.25-27

TEXT: The Minskij stankostroitel'nyy zavod im. Kirova (Minsk Machine Tool Plant im. Kirov) has brought out the special MP55 horizontal broaching assembly, designed by the Special Design Office No. 8 of the Byelorussian Sovnarkhoz and intended for the broaching of pillow bearing cap surfaces of the CMIA (SMD) diesel engine. While the caps of all internal combustion engines manufactured in the USSR were formerly cast and machined individually, they are now cast in one block, all mechanical tooling is done on the block and finally the individual caps are cut off. The assembly is composed of two special horizontal broaching machines connected by an automatic conveyer which effects the loading and unloading of the machines and conveys the components between the machines. The assembly is attended by one operator who puts the work-pieces into the conveyer loading position. With a productivity of 75 sets per hour the assembly replaces ten milling and five broaching machines attended by 15 people. The surfaces of the cap lug are machined

The Horizontal MII55 (MP55) Broaching Assembly

on the first machine, while the surfaces of separation, the semicircumferences and the lock are broached on the second machine. Since the first machine has an upper working carriage and the second has a lower one, the upper and lower surfaces can be broached without tilting the component which considerably simplifies the conveyer installation. All hydraulic devices are mounted on the top plate of the hydraulic container. The broaches are composed of individual carbide-tipped tools mounted on a common rack. The body of the clamping fixture mounted in the central part is a cast portal fastened to the machine bed by claws. To produce the necessary clamping stress, the slide bar is tightened by a wedge, having a stress of 8,000 kg and being displaced by an individual cylinder. The components are shifted by the conveyer bar and set in the machining position. Then the working motion starts and the conveyer bar returns into its initial position. At the end of the working motion the components on both machines are automatically unclamped, the component on the second machine being placed onto the unloading plate. The conveyer bar carries out an advancing stroke, the component is shifted by one step and the clamping fixture unloaded. As soon as the bar returns into its initial position the working carriages are reversed, and, by the following advance stroke, the bar loads the new component into the clamping fixture, while the cycle is repeated. Both radial piston pumps are connected parallel in the hydraulics system.

S/193/60/000/008/006/018
A004/A001

The Horizontal MII55 (MP55) Broaching Assembly

The slowing down of the working carriage travel towards the end of the rough broaching operation and before the gaging operation is effected by switching off the control electromagnets of one pump, as a result of which the pump sliding block is placed in the zero-productivity position while the electromotor keeps running. 100 kg of chips are produced per hour on both machines. From the first machine they fall into a hopper and from the second they are sucked off by a ventilator installation. The following technical characteristics of the machines are given (the data of the second machine being put in brackets): maximum traction stress - 25,500 (57,000) kg; maximum speed of working stroke - 11 (10) m/min; maximum carriage travel - 1,500 (3,150) mm; overall dimensions (length x width x height) - 5,700 (7,900) x 1,450 (2,100) x 1,675 (2,040) mm; weight - 6,000 (13,000) kg. There is 1 figure.

Title: Choice of Optimum Conditions for Measuring Thermal Characteristics Using 2
Temperature-Time Points

Original Periodical: Tr. Leningrad. tekhnolog. in-ta imeni Lensoveta, 1955, 32,
42-45

Abstract: An analysis is made of the accuracy of the method of measuring the thermal characteristics, described in the preceding work of the author (see the preceding abstract). The optimum conditions for the measurement of the coefficient of heat conductivity and of other thermal characteristics are determined.

PHASE I BOOK EXPLOITATION SOV/3005

Gorfman, A. I. and A. R. Dembo

Avtomatika v stroitel'stve (Automation in Construction Works)
Leningrad, Gosstroyizdat, 1959. 183 p. 9,000 copies printed.

Scientific Ed.: N. V. Volotskoy, Candidate of Technical Sciences;
Reviewers: V. A. Timofeyev, Doctor of Technical Sciences and
M. G. Tolstoy, Candidate of Technical Sciences; Ed. of Publishing
House: A. S. Rotenberg; Tech. Ed.: L. V. Voronetskaya.

PURPOSE: This book is intended for engineering and technical
personnel of the building industry.

COVERAGE: The authors discuss the operation of automatic control
system elements used in the building industry and describe ways
of introducing automatic control to this industry. They also
discuss the technical and economic advantages of automatic con-
trol systems. The introduction, sections 1 and 3 of Chapter I,
sections 2, 3 and 4 of Chapter III and Chapter IV were written
by A. I. Gorfman, Candidate of Technical Sciences; section 2
of Chapter I, sections 1 and 2 of Chapter II and sections 1 and

Title: Effects of the Conditions of Production and Storage of Creams and
Cream Products on Their Bacterial Contamination

Original
Periodical:

Tr. Leningr. san.-gigien. med. in-ta, 1953, 11, 178-193

Abstract:

Studied were the factors that determine the initial bacterial contamination of creams and cream pastry, and its changes during 3-day storage. It was found that primary sources of bacterial contamination of cream products are butter, rum syrup and cacao powder. A tendency has been ascertained toward decreased over-all contamination of creams and cream products on 3-day storage at 18°-24° due to a reduction in all forms of microflora. In the course thereof organoleptic properties and acidity of creams made from milk cream showed no changes,

TITLE: Comparative Tests of Electrode Alloys for Projection Welding of a
Cylinder With an Underframe

PERIODICAL: Svarochnoye proizvodstvo, 1960, No. 10, pp. 26-27

TEXT: The authors studied the comparative durability of a series of electrode alloys (Table 1) for projection welding of parts permitting the use of electrodes with a very small operational surface. The alloys were tested in different initial states. Composition and treatment of the alloys are given. Welding was performed on a 175 kvamp 300-PT-12 (300-RT-12) type machine under the following conditions: secondary voltage: 9.8 - 9.9 v; welding time 0.06 sec, number of welds: 30 per minute; compression force applied to electrodes 1,100 - 1,150 kg. A set of 3 parts consisting of a 08 steel underframe, a ring and a cylinder was welded. The durability of the electrodes was estimated by the following characteristics: 1) the deformation of the electrode tip (determined by measurement); 2) electrode oxidation (observed visually);

Comparative Tests of Electrode Alloys for Projection Welding of a Cylinder With
an Underframe

3) frequency of sticking of the part to be welded to the electrode; 4) the degree of electrode chipping (observed visually). The electrode was used for 1 hour producing 1,500 welds. After this time it was replaced, since excessive current density and shunting of current were caused by its continuous use. After regrinding the electrode was reused until its length was reduced to 22-23 mm. Results of tests are given in Table 3. The data obtained show that highest durability was found in МЦ-5Б (MTs-5B) chrome-cadmium bronze, treated by the technology used at the plant (quenching, tempering and hardfacing up to a hardness of HB = 120 - 125 kg/mm²). It is by 60 - 65% cheaper than chrome-beryllium bronze and may be also used for spot and roller welding. Of the remaining alloys chrome-beryllium bronze proved most durable. MTs-4 electrodes were less durable and showed higher oxidation and chipping. Two of six electrodes tested burnt out during the first minutes. Chrome-beryllium bronze, actually used at a number of plants, showed under the experimental conditions highest durability in non-hardfaced state, although slight chipping of the electrodes was observed. Best properties of the alloy are obtained after quenching, hardfacing and

TITLE: Use of a cermet¹⁵ made of tungsten and aluminum oxide in the preparation of
cathodic heaters of electron tubes

SOURCE: AN SSSR. Otdeleniye obshchey i tekhnicheskoy khimii. Issledovaniya v oblasti
khimii silikatov i okislov (Studies in the field of chemistry of silicates and oxides).
Moscow, Izd-vo Nauka, 1965, 257-264

TOPIC TAGS: high temperature cermet material, tungsten, aluminum oxide

ABSTRACT: The aims of the study included (1) the selection of W-Al₂O₃ cermet compositions suitable for the preparation of cathodic heaters, (2) a study of their physical properties (resistivity as a function of temperature, emissivity, strength, porosity, etc.) as functions of the composition and processing. The influence of the regularity of distribution of the metal (tungsten) and oxide (α -Al₂O₃) particles and degree of dispersion of the starting materials on the properties of the sintered cermets was determined. The sintering was found to worsen with rising tungsten content; the shrinkage and relative density decrease, and the porosity increases. The mechanical and elastic properties are determined by the porosity. The optimum combination of

Card 1/2

L 03404-67
ACC NR: AT6027154

properties corresponds to a cermet composition containing 50-75% W and 50-30% Al_2O_3 , and this composition is recommended for applications in industry after final improvements in the process of its preparation are made. Orig. art. has: 5 figures, 5 tables and 1 formula.

Title : THE kinetics of electrochemical oxidation of alpha-naphthoquinone
and its mixtures with naphthalin

Periodical : Zhur. fiz. khim. 29/1, 23-27, Jan 1955

Abstract : The kinetics of electrochemical oxidation of alphas-naphthoquinone and
its mixtures with naphthalin was investigated at temperatures of 30 -
70° by the method of polarization curves. It was found that the total
oxidation reaction is limited by the chemical reaction or diffusion
occurring in the solution.

Institution : The D. I. Mendeleyev Chemical-Technological Institute, Moscow

Submitted : February 15, 1954

Periodical : Zhur. fiz. khim. 29/1, 23-27, Jan 1955

Card 2/2 Pub. 147 - 3/26

Abstract : The addition of oxygen-carrying admixtures was found to have no effect on the rate of the electrochemical oxidation reaction; the process of anodic oxidation of alpha-naphthoquinone is only limited by the diffusion if its molecules migrating toward the electrode. The effect of higher and lower anode potentials on the rate of electrochemical reaction is discussed. One USSR reference (1955). Graphs.

Akademiya nauk Kazakhskoy SSR. Institut yadernoy fiziki.

Metallovedeniye i obrabotka metallov delyoniyem (Physical Metallurgy and Pressworking of Metals) Alma-Ata, 1961. 103 p. (Series: Trudy Instituta yadernoy fiziki, t. 4) 2,450 copies printed.

Resp. Eds.: I. G. Grinman and A. A. Presnyakov; Resp. Secretary: V. V. Chervyakova;
Eds.: N. Ya. Brailovskaya and T. I. Shevechuk; Tech. Ed.: Z. P. Korokina.

PURPOSE: This book is intended for scientific research workers, technical personnel in industry and students and aspirants interested in problems of physical metallurgy and the pressworking of metals.

COVERAGE: The book, Volume IV of the Transactions of the Institute of Nuclear Physics, Academy of Sciences Kazakh SSR, contains papers reviewing problems of physical metallurgy. Attention is given to a consideration of metal ductility, strength, phase transformation, and the ordering of various alloys, and to a discussion of the diffusion mechanism of the plasticity. Experimental findings concerning strength, deformation, and external friction in the working of non-ferrous metals and alloys are included in papers dealing with metal rolling.

SNT/SSCO

Physical Metallurgy and Processing of Metals

Problems of automatic inspection and control of multidraft wire-drawing
processes are also considered. Most of the papers are accompanied by references,
the majority of which are Soviet.

ABSTRACT: (Authors' English summary modified) The authors report the case of a 33-year-old man who received an intraperitoneal injection of bone marrow from his brother, who had been irradiated with 1000 r, on the evening before the transplant. Treatment before the implantation included 1000 r. After a short period of time the patient developed symptoms of radiation sickness. His condition rapidly deteriorated due to the liver failure, and he died 10 days later.

2169. DESTRUCTIVE CHANGES OF THE STERNUM - A szegyessontot pusztító elváltozások - Györgyi A. Orvostud, Egyet, Röntgenklin., Budapest - MAG. RADIOL. 1958, T07/2 (78-85) Tables 1 illus. 8

The sternal bone may be examined in oblique and lateral summation views and on tomograms. Destructive changes due to inflammatory and neoplastic processes are often poor in subjective and clinical signs. The following cases are reported on: osteomyelitis due to a general sepsis following perforation of a gastric ulcer into the liver, rheumatic osteochondritis of the synchondrosis sterni superior, a cystic tumour of the manubrium (osteoclastoma or haemangioma), metastasis of a mammary cancer, lymphogranulomatosis and plasmacytoma. The roentgenogram being insufficient in many cases for an aetiologic diagnosis, electrophoresis affords valuable data for differentiation of inflammatory and neoplastic processes, in addition to histological and other laboratory examinations.

"Data on the Influence of the Thyroid on Blood Coagulation."

Budapest, Honvedorvos, Vol XVIII, No 3, Jul Sep 66, pages 215-220.

Abstract: [Authors' Hungarian summary] A role of the thyroid in the regulation of blood coagulation is made probable by the clinical observation that thrombosis is a more rare complication of hyperthyroidism than of myxedema. Thrombin inactivation is increased in the case of thyroid hyperfunction and is lower than average in the case of thyroid hypofunction. Such changes in the blood-clotting equilibrium must be taken into consideration in the course of anticoagulant therapy as well. 9 Eastern European, 16 Western references.

"The Diagnostic Value of the Test for "Heat- Stable" Lactate Dehydrogenase."

Budapest, Orvosi Hetilap, Vol 104, No 38, 22 Sep 63, pages 1786-1788.

Abstract: [Authors' Hungarian summary] By the repetition of the LDH determination, after the serum had been heat-treated, an indication can be gained about the quantity of the LDH-isoenzyme fraction present, which originates from the heart muscle. In some circulatory diseases, the ratio of total and heat-stable LDH shows characteristic changes which are indicative of deficiencies of the liver or of the heart muscle. Low organ specificity, one of the disadvantages of the heat-stable LDH was an especially useful additional tool in the differential diagnosis of heart infarct among their patients. 1 Hungarian, 10 Western references.

"Treatment of the Adult Type of Pulmonary Tuberculosis During Adolescence With Special Emphasis on Pneumothorax Therapy."

Budapest, Orvosi Hetilap, Vol 108, No 11, 12 Mar 67, pages 487-489.

Abstract: [Authors' Hungarian summary] In response to a three-fold inhibitor therapy, complete healing was achieved in 80-86 per cent of the adolescents with recent infections. In the remaining 15-20 per cent of the cases, pneumothorax therapy was attempted. Resection was decided upon only after other surgical therapies had failed to give satisfactory results. The pneumothorax was usually maintained for 12-18 months. It was, of course, greatly dependent on the condition of the pneumothorax. The "more dry" and free of complication was the pneumothorax, the longer could it be maintained. Sectional roentgenograms taken in the sagittal and lateral directions were used at three-month intervals during the pneumothorax treatment to check the disappearance of the cavern; out of 49 cases, it disappeared within 3 months in 25 cases (51 per cent) and within 6 months in 9 cases. Thoracoscopy was performed in every case to check for the presence of adhesions, 4-8 weeks after the pneumothorax was initiated. A complete pneumothorax could be achieved by means of cauterization in 39 out of 49 cases. If the

55

ABSTRACT:

The types of steroids into which the activity of H^3 -progesterone is incorporated by regenerating adrenal tissue have been studied in order to obtain information as to the cytogenesis of the regenerating cells and the pathogenesis of the consequent hypertension (SKELTON). At variance with literature data, it was found that, after a brief initial period, only the functions of the internal zones persisted in the re-

Card 1/2

L 15487-66

ACC NR: AT6007457

generating adrenal tissue while those of the zona glomerulosa have ceased. The activity was mainly incorporated into 18-OH-DOC and corticosterone, hardly any into 18-OH-corticosterone, and none into aldosterone. The appearance of a substance intermediate in polarity between aldosterone and 18-OH-DOC was observed on the activity curve. It is believed that a correlation may exist between the results obtained and certain pathological changes, i.e., the pathological effects may have an influence on the physiological process of adrenal transformation (for example, following treatment with formalin, the function of the zona glomerulosa gains preponderance). 992. GÖRGÉNYI-GÖTTCHE O. Staatl. Kindersanat., Budapest. *Die Lokalisation tuberkulöser Lungenerkrankungen im Kindesalter. Localization of pulmonary tb in childhood TUBERKULOSEARZT 1956, 10/5 (259-274) Tables 6 Illus. 16

In 200 cases of tb in children the localization of the primary focus was determined on the basis of X-rays in 2 planes. The right upper lobe was the site of the primary focus in 30% of cases, the left upper lobe in 25%, the right lower lobe in 20% and the left lower lobe in 16%, while the right middle lobe was affected in 8%. Calcified primary foci showed the following distribution over segments: right axillary subsegment in 12.5%, right 3rd segment in 11%, left 3rd segment in 8.5%, left axillary subsegment in 7.5%, right 8th segment in 8%, right 4th and 5th segments in 7%, 4th lingular branch in 5%, 5th lingular branch in 1.5%, and right 6th segment in 5.5% of cases. Calcified primary foci in the 9th and 10th left lower lobe segments were rare. In 1000 cases of epithuberculosis the right upper lobe was the most frequent localization, followed by the right middle lobe and the left upper lobe. Epithuberculosis of the right upper lobe was localized mainly in the 3rd segment; in the left upper lobe the 2nd and 3rd segments were equally frequently affected. Early adult tb shows entirely different localizations from tb in children. The chief localizations are the 1st and 2nd segments on the right, followed by the 1st and 2nd segments on the left and the 6th segment right and left. Early adult tb has the same localizations as Simon's apical foci and initial foci. If the latter are haemogenous then adult tb must also be haemogenous. The primary foci in adult age immediately show the adult type.

State Sanatorium for Children (Allomű Gyermekszállásház) in
Csepelmagyar [near Budapest].

The First Section for the Treatment of Tuberculous Adolescents was

opened, Orvosi Értesítő, Vol 104, no 7, 17 Feb 1963, pp. 344-50.

Budapest: Owing to the decrease in the number of tuberculous in-
fected, the hospital located at the Freedom Boulevard (Szabadság út),
Budapest, has been designated as an institution for the treat-
ment of tuberculous adolescents only. The article reviews the reasons
for this decision. Facilities include training courses in grade- and
high-school subjects; also in sewing, gardening, photography, etc.
By transferring adolescents from institutions for adults, a signifi-
cant number of hospital beds were made free for more efficient use.

GORGIDZE, A. Ya.

Gorgidze, A. Ya. Stretching and twisting of composite
beams near to prismatic ones. Soobz. Akad. Nauk
Gruzin. SSR. 8 (1947), 605-612. (Russian)

A slightly tapered composite beam with one fixed end
is subjected to the action of a (a) tensile force on the free
end, and (b) torsion couple on the free end. If the lateral
surface of the beam is determined by the equation
 $f'(1 - kz), y(1 - kz) = 0$, where z is directed along the
length of the beam and $kz \ll 1$, then the displacements in
the problem (a) are given by formulas (17) and those for
problem (b) by (27), provided that the Poisson constants
of materials composing the beam are equal.
